Dashboard Project – Sales Dataset (Power BI)

Using the provided **Sales Dataset**, build an interactive **Power BI dashboard** that answers meaningful business questions and provides insights into sales performance, products, customers, and regional trends.

Requirements

- Import and connect all dataset tables into Power BI.
- Clean and transform the data using **Power Query**.
- Create a proper **data model** by defining relationships between tables.
- Create **5 calculated columns**.
- Create **5 DAX measures**.
- Add at least **3 KPI Cards**.
- Create at least **2 report pages**.
- Include multiple visualizations such as bar charts, line charts, pie charts, maps, tables, and matrices.
- Add **Slicers** and **Filters** for interactivity.
- Apply a consistent report theme, page titles, and formatting.
- Publish the report to the **Power BI Service**.

Dataset

The dataset includes four related tables that provide information about **customers**, **products**, **regions**, and **sales transactions**. These tables can be used together to analyze **sales performance**, **product trends**, **customer details**, and **regional distribution**.

Instructions

Do not follow a predefined dashboard design.

Before creating the dashboard, consider the project from the perspective of the intended audience. Think about the business decisions the dashboard should support and identify the key questions a business owner or manager would want answered.

As a data analyst, explore the dataset and determine:

- Which business questions should be answered.
- Which calculated columns and DAX measures should be created.
- Which KPIs provide the most meaningful insights.
- Which visualizations best communicate the findings.
- Which slicers and filters improve user interaction.
- How the report pages should be organized to present information clearly and effectively.

Your dashboard should be designed with a **business-first approach**, ensuring that every visual element has a clear purpose and contributes to answering a meaningful business question. Focus on presenting actionable insights rather than simply displaying data.

The final dashboard should enable stakeholders to monitor performance, identify trends, evaluate products and regional performance, and make informed, data-driven decisions.
